Colligative properties are properties that depend only upon the number of solute atoms, ions, or molecules in a solution and not on the nature of those atoms, ions or molecules. Freezing point depression and boiling point elevation are examples of colligative properties.

CHEMISTRY COLLIGATIVE PROPERTIES WORKSHEET - Mr. Winters

Solutions and Colligative Properties Introduction: Solutions: Mixture of two or more components. Depending on size of components, mixtures are classified into 3 types. a) Coarse mixture: Definition: The mixture which contains components having relatively bigger size is called as coarse mixture. E.g. Mixture of salt and sugar.

For all substances the colligative properties are independent of size or molecular weight, e.g. a 0.01mM solution of ribonuclease (MW = 13,700 daltons) will have the same colligative properties (bp, fp, osmotic pressure, etc.) as a 0.01mM solution of methanol (CH₃OH, MW = 32).

Boiling Point/Freezing Point Depression Worksheet Answer

Colligative properties depend only on the number of dissolved particles (that is, the concentration), not their identity. Raoult's law is concerned with the vapour pressure depression of solutions. The boiling points of solutions are always higher, and the freezing points of solutions are always lower, than those of the pure solvent.

Colligative Properties of Solutions – Introductory

The answer to that question depends on three things: the molality of the solution, the van't Hoff factor of the solute, and the molal freezing-point-depression constant of the solvent. We will take a look at each of these

Chemistry of Ice-Cream Making: Lowering the Freezing Point

Often, the problem will give you the change in temperature and the proportionality constant, and you must find the molality first in order to get your final answer. The solute, in order for it to exert any change on colligative properties, must fulfill two conditions.
