A field-programmable gate array (FPGA) is an integrated circuit designed to be configured by a customer or a designer after manufacturing – hence the term "field-programmable".The FPGA configuration is generally specified using a hardware description language (HDL), similar to that used for an application-specific integrated circuit (ASIC). Circuit diagrams were previously used to specify ...

The new FA-M3V series. The FA-M3 is designed and best known for its speed so it's only natural that the new series be named FA-M3V, where V stands for "Vitesse", which means speed in French.

Supervisory control and data acquisition (SCADA) is a control system architecture that uses computers, networked data communications and graphical user interfaces for high-level process supervisory management, but uses other peripheral devices such as programmable logic controller (PLC) and discrete PID controllers to interface with the process plant or machinery.

The First Time Designerâ€™s Guide is a basic overview of Intel embedded development process and tools for the first time user. The chapter provides information about the design flow and development tools, interactions, and describes the differences between the Nios Â® II processor flow and a typical discrete microcontroller design flow.
