A fundamental building block of economic theory is the fact that increasing (or decreasing) the price of a commodity reduces (or increases) demand for that commodity.

13.1 Price elasticity of demand for tobacco products

Price elasticity of demand (PED or E_d) is a measure used in economics to show the responsiveness, or elasticity, of the quantity demanded of a good or service to a change in its price when nothing but the price changes. More precisely, it gives the percentage change in quantity demanded in response to a one percent change in price. Price elasticities are almost always negative, although ...

A standard example of an entropic force is the elasticity of a freely-jointed polymer molecule. For an ideal chain, maximizing its entropy means reducing the distance between its two free ends. Consequently, a force that tends to collapse the chain is exerted by the ideal chain between its two free ends.

These show the range of elasticities from various studies. Numbers in parenthesis indicate the original authors' "best guess" values. After a detailed review of international studies, Goodwin, Dargay and Hanly (2003) produced the average elasticity values summarized in Table 3.

Mapeflex PU45 withstands movements when in service up to 20% of the average width of the sealed joint. If movements are greater than 20% when in service, use Mapeflex PU40 polyurethane sealant with a low modulus of elasticity.
